

We have decided to use a Risk Register in a tabular format to keep track of possible risks. This allows us to add risks as they appear, as well as assign and change stats such as their Likelihood, Severity and links to requirements.

We chose these columns because it allows us to easily describe the risk's damage to the project; a property which will be extremely important for when the project changes hands to another team. This is also the reason that we have omitted a responsibility owner as that will change for every single risk once we have handed over the project to a new team.

The ID of a linked requirement will allow us to easily see which requirements might be compromised by a risk and further allows us to formulate mitigation strategies.

ID	Type	Description of Risk	Likelihood	Severity	ID of linked Requirement (Optional)	Mitigation
----	------	---------------------	------------	----------	-------------------------------------	------------
